1. (Original) A method in a wireless communications device, the

method comprising:

determining a distance of the wireless communications device

from a base station;

determining timing advance, at the wireless communications

device, for the base station based on the distance of the wireless

communications device from the base station;

using the timing advance determined for transmitting to the base

station.

2. (Original) The method of Claim 1,

determining a location of the wireless communications device,

determining the distance of the wireless communications device

from the base station using the location of the wireless communications device

and a location of the base station.

3. (Original) The method of Claim 2, the wireless communications

device includes a satellite positioning system receiver, determining the

location of the wireless communications device by obtaining a satellite

positioning system based location fix.

4. (Original) The method of Claim 2, obtaining the location of the

base station based on known timing advance information for different

locations with a cell served by the base station.

2

Appl. No. 10/645,568 Confirm. No. 7858 Examiner H. Foud Art Unit 2616

5. (Currently Amended) The method of Claim 2, obtaining the

location of the base station based on [by] receiving a message including base

station location information.

6. (Original) The method of Claim 2, obtaining the location of the

base station from a table of base station locations stored on the wireless

communications device.

7. (Original) The method of Claim 6, obtaining the base station

locations stored in the table by downloading to the wireless communications

device.

8. (Currently Amended) The method of Claim 1, determining the

timing advance at [in] the wireless communications device for transmitting

voice over a packet network.

9. (Currently Amended) The method of Claim 1, determining the

timing advance at [in] the wireless communications device during a push-to-

talk session over a packet network.

10. (Currently Amended) A method in a wireless communications

device, the method comprising:

obtaining satellite positioning system time from a satellite

positioning system, obtaining satellite positioning system time from the base

station;

3

determining a propagation delay between the wireless communications device and a base station, the <u>propagation delay determined</u> using the satellite positioning system time from the satellite positioning system and the satellite positioning system time from the base station;

determining timing advance, in the wireless communications device, for the base station based on the propagation delay between the wireless communications device and the base station;

using the timing advance determined for transmitting to the base station.

Claim 11 (Canceled).

12. (Original) A method in a wireless communications device, the method comprising:

obtaining first timing information for the wireless communications device at a first known location relative to a base station;

obtaining second timing information for the wireless communications device at a second known location relative to the base station;

determining a location of the base station based on the first and second timing information and based on the first and second known locations.

13. (Original) A method in wireless communications device, the method comprising:

determining a difference between a current cell timing and a prior cell timing for a common serving cell;

determining a current timing advance for the common serving cell using the difference between the current cell timing and the prior cell timing and using a prior timing advance corresponding to the prior cell timing.

14. (Original) The method of Claim 13,

using the current timing advance for communicating with the network,

determining the current timing advance before communicating with the network.

15. (Original) A method in a wireless communications device having a look-up table providing timing advance information associated with different locations relative to at least one base station, the method comprising:

determining a location of the wireless communications device;

determining timing advance information for the location of the wireless communication device from the look-up table.

- 16. (Original) The method of Claim 15, determining timing advance information for the location of the wireless communication device using timing advance information in the look-up table only if the location of the wireless communications device is within a specified distance of a location in the look-up table for which timing advance information is provided.
- 17. (Original) The method of Claim 15, obtaining timing advance information from a source other than the look-up table if the location of the

wireless communications device is not within a specified distance of a location in the look-up table for which timing advance information is provided.

18. (Currently Amended) The method of Claim 15, updating the

look-up table with the timing advance information obtained from a [the]

source other than the look-up table.

19. (Original) The method of Claim 18, determining timing

advance information from the look-up table when communicating voice over a

packet network.

20. (Original) A method in a wireless communications device, the

method comprising:

determining timing advance on the wireless communications

device;

transmitting a modified burst to a network using the timing

advance determined on the wireless communications device.

21. (Original) The method of Claim 20, transmitting the modified

burst includes transmitting a modified access burst having a reduced guard

time relative to an un-modified access burst.

22. (Currently Amended) The method of Claim 20, transmitting

the modified burst includes transmitting a modified normal burst having [a]

an increased guard time relative to an un-modified normal access burst,

without first transmitting an access burst.
